

The Free Scroll-Trigger 3D Website Guide

This is the exact process to turn **one product photo** into an Apple-style website where the product **explodes into its parts as you scroll**. No 3D software, no coding, no paid tools. If you can upload a photo and copy-paste, you can do this.

What you will end up with: a full-screen site where scrolling plays a smooth image sequence. The product starts whole, comes apart into a floating exploded diagram, then goes back together, with clean text appearing on each step.

Time: about 30 to 45 minutes. **Cost:** free. **Skill needed:** none, seriously.

Everything you need (all free)

- ☐ One clean product image (a real photo works, or make one with AI)
- ☐ **Google Flow** for the exploded image and the video
- ☐ **ezgif.com** to turn the video into frames
- ☐ An AI tool to build the site (Claude, Cursor, v0, Bolt, or Lovable)
- ☐ **VS Code + Live Server** to preview, or **Vercel** to put it online free

Do not worry if you have not used these before. Each step below tells you exactly what to click.

Read this first, it is the secret

Every frame needs a **flat, single-color background**, and your **website background has to be the exact same color**. That is the whole trick. It makes the product look like it is floating in space with no visible photo edge. Pick one background color, write down its hex code, and use that same code everywhere.

Two more things that make it look expensive: keep the **camera locked** and keep the **product the same size** in every frame. Consistent frames equal a smooth, premium scroll.

Step 1 — Get a clean product image

You need one nice hero shot.

- One product, centered, on a plain flat background.
- Even lighting, no clutter, nothing else in the frame.
- Landscape (16:9) is best for a full-screen site.

You can use a real photo you already have, or generate one in Google Flow using **Prompt A** below. A real photo usually looks the most realistic, because the AI only has to explode it, not invent it.

Step 2 — Make the exploded version (Google Flow)

Open Google Flow, upload your photo, and use **Prompt B** in edit mode. The idea is to keep the product exactly the same and only pull it apart into floating layers.

Now you have two images:

- **Start frame:** the assembled product (your Step 1 photo)
- **End frame:** the exploded version

Keep the same camera, same size, same background color in both. That is what lets the next step animate smoothly.

Step 3 — Turn those two images into a video (Google Flow)

In Flow, use the image-to-video option:

- Set the **start frame** to your assembled image
- Set the **end frame** to your exploded image
- Use **Prompt C**: smooth motion, locked camera, background stays the same, no cuts

You get a short clip of the product coming apart.

Want it to come back together too? In the next step you can add a reversed copy of the clip after the first one.

Step 4 — Turn the video into frames (ezgif)

1. Go to ezgif.com and open **Video to JPG**.
2. Upload your clip.
3. Set the **frame rate to 30**. This is what makes the scroll buttery.
4. Convert, then **download the ZIP** of numbered images.

Step 5 — Build the website (your AI tool)

Open your AI tool. Upload the ZIP of frames and paste **Prompt D**. It builds a site that pins a full-screen canvas, plays your frames as you scroll, and uses your background color so the product floats. It also adds simple text on each scroll step.

If the tool asks, put the frames in the images folder it made.

Step 6 — Preview it, then put it online (free)

- **Preview:** open the folder in VS Code, install the **Live Server** extension, right click the HTML file, choose "Open with Live Server."
- **Publish free:** drag the folder into **Vercel**. You get a live link in about a minute.

That is it. You just built a premium scroll website from one photo.

The prompt pack (copy, paste, swap your product)

Replace **PRODUCT** with your item. Pick a background color and write its hex where it says **#BACKGROUND**, for example a warm cream **#d3ccc0** or near-black **#050505**. Use the same hex in all of them.

Prompt A — Hero image (only if you are generating it)

Hyper-realistic studio product photograph of a **PRODUCT**, centered and floating, on a perfectly flat seamless **#BACKGROUND** background with no gradient and no floor line. Soft light from the upper left, realistic materials, gentle shadow, clean and premium. 16:9. No text, no logos, no props.

Prompt B — Exploded end frame (edit of your hero image)

This is an image edit, not a new image. Take the uploaded **PRODUCT** and separate it into a clean exploded diagram, while keeping everything else identical.

Preserve exactly: the same product, colors, and materials; the same camera angle and perspective; the same size and centering; the same 16:9 crop; the same flat **#BACKGROUND** background; the same lighting.

Transform only: pull the product apart into its real parts, floating and evenly spaced, each layer with a soft shadow, like a calm blueprint. Nothing rotates, nothing drifts off center.

Do not change the camera, background, or size. Do not add text or logos. Keep it photorealistic.

Prompt C — Animation (image to video, start to end)

A cinematic product animation. The **PRODUCT** starts fully assembled and smoothly comes apart into a floating exploded diagram, each part easing into place. The camera is completely locked, no pan, no zoom, no shake. The background stays a flat **#BACKGROUND** the whole time. Slow, smooth, premium motion, no bounce. About 5 seconds.

Avoid: camera movement, background changes, parts spinning, motion blur, text overlays.

Prompt D — The website (paste with the ZIP of frames)

Build a single self-contained scroll telling landing page (index.html, styles.css, script.js, no framework, runs on Live Server) for a **PRODUCT**.

Core idea: a full-screen canvas pinned in a sticky section tall. As the user scrolls from 0 to 100 percent, map scroll progress to a frame number and draw the image sequence from the frames folder (frame_0001 upward). Ease the frame toward its target each animation frame so the scroll is buttery.

Preload the frames.

The page background and the canvas must both be exactly **#BACKGROUND**, matching the frames, so the product floats with no visible edge.

Add a minimal fixed top nav that is transparent at the top and blurs slightly after scrolling.

If it does not look right

- You see a rectangle around the product. Your frame background and site background do not match. Make the hex identical.
- The scroll looks jumpy. The camera moved or the product changed size between frames. Lock the camera, keep the size the same.
- The scroll stutters. You forgot to set 30 fps in ezgif.
