

TalentIQ - Proof-to-Hire Passport

Hackathon product summary

USP

TalentIQ turns scattered work into a role-specific, explainable hiring brief:
what a candidate can do, why the evidence is credible, and what risk remains.

What makes it different

Instead of black-box scores or resume keywords, every competency is linked to source evidence from code, hackathons, presentations, team delivery, and interviews.

Implemented vertical slice

- Protected recruiter route: /recruiter/passport
- Role readiness, evidence confidence, trust risk, and source inspection
- Competency proof graph and a next-best targeted interview action
- Recruiter-only APIs with organization access: GET /api/passports/featured and POST /api/passports/:candidateId/targeted-interview

Scale and business path

Use queued connector adapters for GitHub, hackathons, uploads, and interviews.
Keep immutable provenance, hashes, timestamps, consent, and scoring versions.
Sell first to organizers and campuses, then recruiter subscriptions and enterprise ATS.

Validation

Frontend production build passed. Backend typecheck passed. 32 backend tests passed, including Passport authorization, response completeness, and interview queue contracts.

Important: evidence is seeded and clearly disclosed. Live provider verification requires configured credentials, production data, and governance before real hiring use.
